

Math 30-2: U5L1 Teacher Notes
Exploring the Graphs of Polynomial Functions

Key Math Learnings:

By the end of this lesson, you will learn the following concepts:

- Describe, orally and in written form, the characteristics of polynomial functions by analyzing their graphs.

Polynomial Functions

Polynomial Function

A polynomial function contains only the operations of multiplication and addition with real numbers and variables.

$$f(x) = 5x^3 + 6x^2 - 3x + 7$$

The function can also be written as

$$f(x) = 5(x)(x)(x) + 6(x)(x) + (-3)(x) + 7$$

Degree

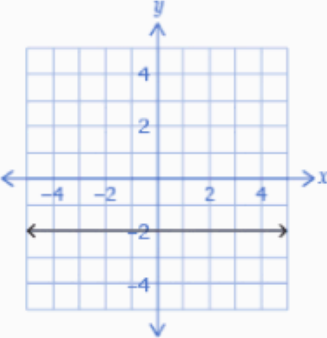

The highest exponent (on a variable) is called the degree of the polynomial. In Math 30-2, you will work with degree 0, 1, 2, and 3 polynomial functions.

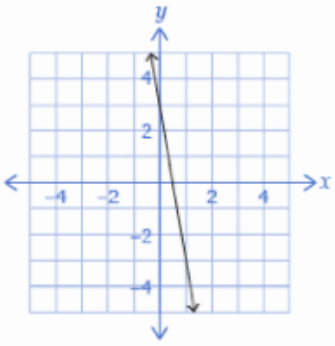

Degree	Name	Example
0	constant	$f(x) = 3.5$
1	linear	$f(x) = 4x - 1$
2	quadratic	$f(x) = 3x^2 + 6x - 1$
3	cubic	$f(x) = 5x^3 - 4x^2 + 7x + 3$

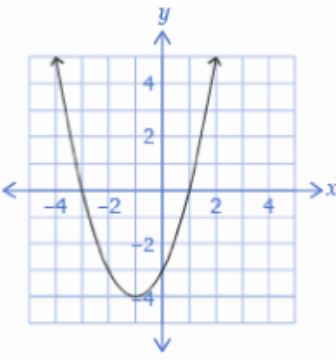

Graphs of Constant, Linear, Quadratic and Cubic Functions

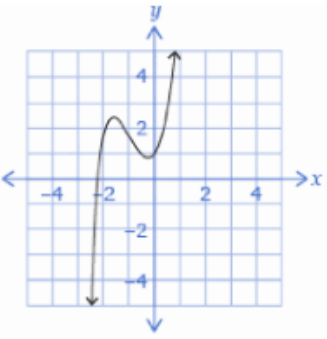

In order to do this lesson we need to review a few concepts of graphs of polynomial functions.

- **x - intercept** is the point or points at which the graph crosses the x-axis.
- **y - intercept** is the point at which the graph crosses the y - axis.
- The **domain** of a function is the set of all possible input values (usually x), which allows the function formula to work.
- The **range** is the set of all possible output values (usually y), which result from using the function formula.

Type of Function	Example Equation	Example Graph	Characteristics of Example Graphs
Constant	$f(x) = -2$		<p>The graphs of constant functions are horizontal lines.</p> <p>There is no x-intercept (does not cross the x-axis)</p> <p>y-intercept = -2 (crosses the y-axis at -2)</p> <p>Domain: x is a member of real numbers</p> <p>Range is y = -2 or the constant term</p>

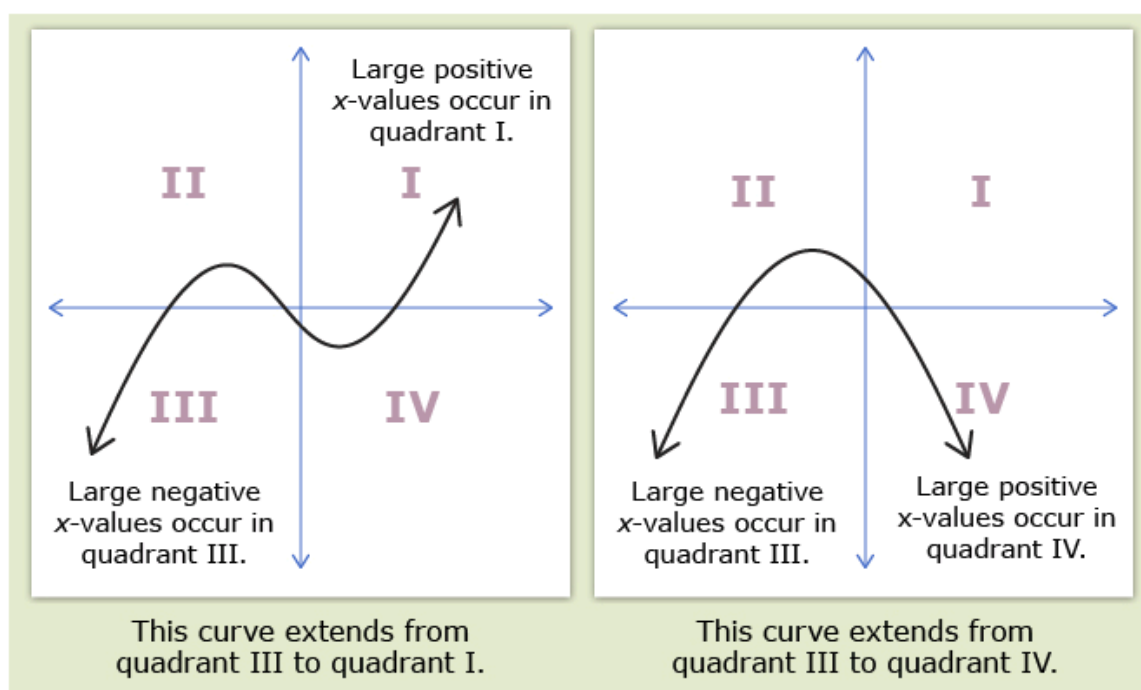

Linear	$f(x) = -5x + 3$		<p>The graphs of linear functions are diagonal lines.</p> <p>x-intercept = 0.5 (crosses the x-axis at 0.5)</p> <p>y-intercept = 3 (crosses the y-axis at 3)</p> <p>Domain: x is a member of real numbers</p> <p>Range: y is a member of real numbers</p>
---------------	------------------	---	--

Quadratic	$f(x) = x^2 + 2x - 3$		<p>The graphs of quadratic functions are parabolas.</p> <p>x-intercepts = -3 and 1</p> <p>y-intercept = -3</p> <p>Domain: x is a member of real numbers</p> <p>Range: y is greater than or equal to -4</p>
------------------	-----------------------	---	--

Cubic	$f(x) = 2x^3 + 5x^2 + 2x + 1$		<p>The graphs of cubic functions are curvy.</p> <p>x-intercept = -2.2</p> <p>y-intercept = 1</p> <p>Domain: x is a member of real numbers</p> <p>Range: y is a member of real numbers</p>
--------------	-------------------------------	---	---

End Behavior

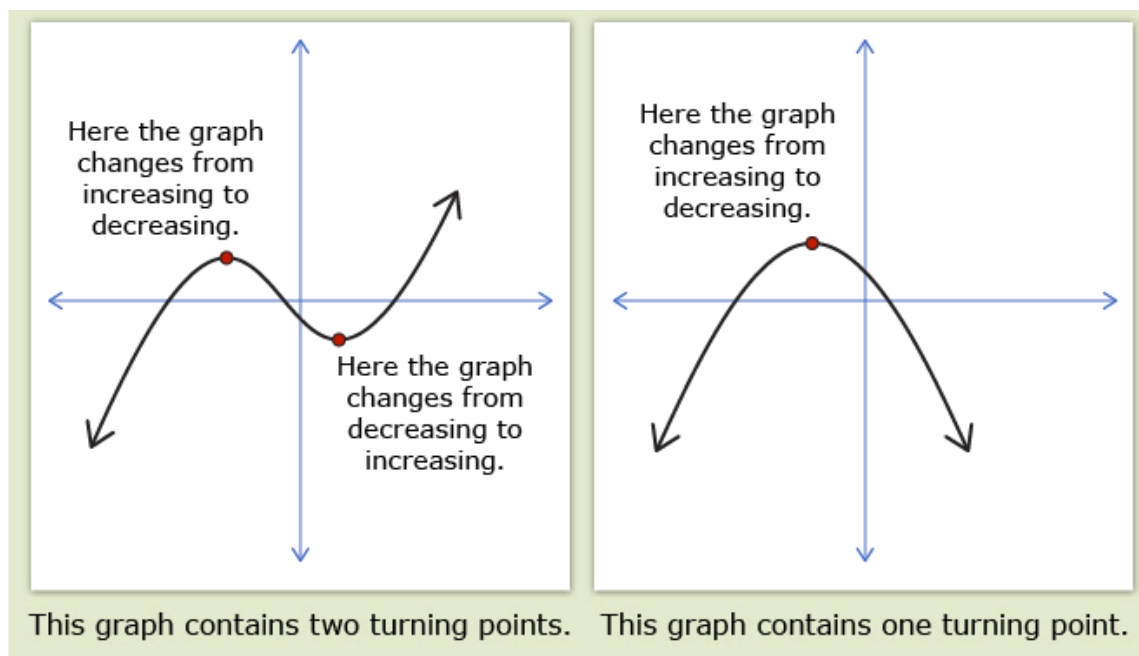

The **end behaviour** of a graph describes what happens as the x -values become very large positive or very large negative numbers. In this course, you will typically describe end behaviour by stating the quadrant the graph is in for large negative x -values and large positive x -values.

Turning Points

A **turning point** occurs when a graph changes from increasing to decreasing or from decreasing to increasing.

In the definition for turning point, describing a function that is decreasing means the curve is falling from left to right. Describing a function that is increasing means the curve is rising from left to right.

**Practice Problem:**

Complete “Further your Understanding” question 1 on page 277 of your textbook.

Solution:

1. a) This is not a polynomial function since the graph has infinitely many turning points.
- b) This is a polynomial function since the graph extends from quadrant II to quadrant I, it has 1 y -intercept, 1 turning point and 2 x -intercepts. It is a quadratic function.
- c) This is a polynomial function since the graph extends from quadrant III to quadrant I, it has 1 y -intercept, 2 turning points and 3 x -intercepts. It is a cubic function.
- d) This is a polynomial function since the graph extends from quadrant II to quadrant IV, it has 1 y -intercept, no turning points and 1 x -intercept. It is a linear function.
- e) This is not a polynomial function because it has no x -intercepts and it is not a constant function.
- f) This is not a polynomial function since the domain of this graph is not $\{x \mid x \in \mathbb{R}\}$.

Practice Problem:

Complete “Further your Understanding” question 2 b, c and d on page 277 of your textbook.

Solution:

2. b) x-intercepts: $-5, -1$

y-intercept: 2

End behaviour: curve extends from quadrant II to quadrant I

Domain: $\{x \mid x \in \mathbb{R}\}$

Range: $\{y \mid y \geq -2.5, y \in \mathbb{R}\}$

Number of turning points: 1

Solution:

c) x-intercepts: $-2, -1, 1$

y-intercept: -5

End behaviour: curve extends from quadrant III to quadrant I

Domain: $\{x \mid x \in \mathbb{R}\}$

Range: $\{y \mid y \in \mathbb{R}\}$

Number of turning points: 2

d) x-intercept: 0.5

y-intercept: 2

End behaviour: line extends from quadrant II to quadrant IV

Domain: $\{x \mid x \in \mathbb{R}\}$

Range: $\{y \mid y \in \mathbb{R}\}$

Number of turning points: 0

**Practice Problem:**

Complete “Further your Understanding” question 3 on page 277 of your textbook.

Solution:**3. a)**

Number of x-intercepts: 1

y-intercept: -1

End behaviour: line extends from quadrant III to quadrant I

Domain: $\{x \mid x \in \mathbb{R}\}$

Range: $\{y \mid y \in \mathbb{R}\}$

Number of turning points: 0

b)

Number of x-intercepts: 0

y-intercept: 4

End behaviour: curve extends from quadrant II to quadrant I

Domain: $\{x \mid x \in \mathbb{R}\}$ Range: $\{y \mid y \geq 4, y \in \mathbb{R}\}$

Number of turning points: 1

c)

Number of x-intercepts: 1

y-intercept: 3

End behaviour: curve extends from quadrant II to quadrant IV

Domain: $\{x \mid x \in \mathbb{R}\}$ Range: $\{y \mid y \in \mathbb{R}\}$

Number of turning points: 0

d)

Number of x -intercepts: 1 y -intercept: 0

End behaviour: curve extends from quadrant III to quadrant I

Domain: $\{x \mid x \in \mathbb{R}\}$ Range: $\{y \mid y \in \mathbb{R}\}$

Number of turning points: 0

e)

Number of x -intercepts: 0 y -intercept: -3

End behaviour: line extends from quadrant III to quadrant IV

Domain: $\{x \mid x \in \mathbb{R}\}$ Range: $\{y \mid y = -3\}$

Number of turning points: 0

f)

Number of x -intercepts: 2

y -intercept: -7

End behaviour: curve extends from quadrant III to quadrant IV

Domain: $\{x \mid x \in \mathbb{R}\}$

Range: $\{y \mid y \leq 2, y \in \mathbb{R}\}$

Number of turning points: 1

Practice Problem:

Complete "Further your Understanding" question 4 on page 277 of your textbook.

Solution:

a)

b)

c)
